1.

Draw a simple diagram (hand-drawn or digital) showing how your phone connects to Instagram, including your device, WiFi router, ISP, and Instagram server. Label each part and the connections.

Ans

2.

List 5 devices you use or see daily that are part of a network (for example: smartphone, smart TV, WiFi router, laptop, smartwatch). For each, write what type of network it connects to (LAN, WAN, PAN, etc.).

Ans

No.	Device	Network type	Explanation
1	Smartphone	WAN / LAN	Uses the internet through mobile data (WAN) or Wi-Fi (LAN).
2	Laptop	LAN	Connects to a local network through Wi-Fi or Ethernet.
3	Smart TV	LAN	Connects to the home Wi-Fi router to stream videos.
4	Smartwatch	PAN	Connects to a smartphone using Bluetooth.
5	Wi-Fi Router	LAN / WAN	Connects local devices and provides access to the internet.

Network types:

- LAN: Local Area Network — covers a small area, such as a home or college.
- WAN: Wide Area Network — connects across large areas, including the internet.
- PAN: Personal Area Network — connects personal devices over a short distance, usually using Bluetooth.

3.

Explain the difference between the Internet and an intranet using an example from your college or a public WiFi you have used.

Ans

Difference Between Internet and Intranet

Internet	**Intranet**
The Internet is a worldwide public network.	An intranet is a private network used within an organization.
Anyone with an Internet connection can access public websites.	Only authorized users can access the intranet.
Example: Google, YouTube, and Instagram.	Example: A college's internal student portal.

Example from my college:

When I use college Wi-Fi to watch YouTube or search on Google, I am using the Internet. When I log in to my college's private portal to check attendance, notes, or exam results, I am using the intranet.

Conclusion: The Internet connects people worldwide, while an intranet connects authorized users within an organization.

4.

Pick any one app you use (like WhatsApp, Zomato, or Flipkart) and describe, in 4-5 lines, how data travels from your device to their server and back when you perform a search inside the app.

Hint: Mention the devices and networks involved, and what happens when you hit 'search'.</ew>

Ans

Example: Searching on Flipkart

1. I open the Flipkart app on my smartphone and type a product name in the search box.
2. When I tap Search, my phone sends the search request through Wi-Fi or mobile data to the Internet.
3. The request travels through my router or mobile network and reaches the Flipkart server.
4. The Flipkart server processes my request, finds matching products, and sends the results back through the Internet.
5. My smartphone receives the data and displays the list of products on the screen.
